Data Analysis with SAS / SPSS / R

PRACTICAL NO 3 MODULE 2

AIM: Creating cross-tabulations and two-way tables using table ()

OUTPUT:

The screenshot shows the RStudio interface. The console on the left displays the following R code and its output:

```
> # Practical 3: Cross-Tabulation using table()
> # Load dataset
> df <- read.csv("uber_driver_trip_analysis.csv",
+               stringsAsFactors = FALSE)
> # Select categorical columns
> categorical_data <- df[apply(df, function(x)
+                               is.character(x) || is.factor(x))]
> # Create two-way table
> print("--- Cross-Tabulation ---")
[1] "--- Cross-Tabulation ---"
> cross_tab <- table(categorical_data[[1]],
+                   categorical_data[[2]])
> print(cross_tab)
```

The output is a two-way table showing the relationship between 'City' and 'Payment Type'.

	Cash	Credit Card	UPI	Wallet
Dubai	844	830	858	841
London	860	828	815	800
Mumbai	790	855	827	838
New York	818	786	855	844
Singapore	786	869	867	853
Sydney	834	853	838	811
